Women of Courage - Katherine Martin 2010-10-06

The 41 ordinary and well-known women honored in this first book in New World Library's "People Who Dare" series have shown forms of bravery that, according to editor Martin, go largely unrecognized - such as persevering in adverse circumstances, challenging tradition, showing vulnerability, fostering healing, and listening to one's heart. Concern about her children's education impelled Patty Murray (currently U.S. Senator from Washington) to run against an incumbent and win a seat in her state senate. Acting out of a deeply felt commitment to the poor, Dr. Janelle Goetcheus, along with other physicians she recruited, founded Christ House, a renovated apartment building where seriously ill homeless patients stay and receive care. After she was diagnosed with breast cancer, Laura Evans celebrated her survival by founding Expedition Inspiration, an organization that takes breast cancer survivors on mountain climbs. Cora Lee Johnson's longtime dream of starting a community sewing center became a reality when she was 62 because, although poor and uneducated, she persevered by talking about the center to anyone who would listen. Men and women both will find inspiration for their own lives in these captivating stories.

Enrichment of Minority DNA in Admixes of DNA Samples - Tara Miran 2012

Non-invasive prenatal diagnosis (NIPD) is a promising approach that is currently being developed. The principle is that fetal material can be detected in maternal plasma and potentially enable women to pursue reliable and timely prenatal diagnosis, whilst eliminating the risk of miscarriage associated with chorionic villus sampling or amniocentesis. However NIPD research has been restricted up until now for the diagnosis of Down syndrome due to the low concentration of free fetal DNA (ffDNA) in maternal plasma. Various methods have been developed in an attempt to increase the concentration of ffDNA. This study uses COLD-PCR (co-amplification at lower denaturation temperature PCR) to analyse potential enrichment of ffDNA over maternal DNA through optimization of the critical denaturation temperature (Td), using Real Time-PCR in an attempt to selectively enrich smaller fetal DNA fragments. Fake fetal DNA was created in two different spike experiments to imitate the natural environment of viable ffDNA. One spike experiment used 5% of fake fetal DNA in a 95% maternal background to represent levels of ffDNA during early pregnancy. The other spike experiment utilized 10% of fake fetal DNA in 90% maternal background to denote late pregnancy. Before running COLD-PCR, various adjustments took place to find the critical Td at which one could run the spike experiment by COLD-PCR. Products of spike experiment were analysed on a genetic analyser for fragment analysis. Melt curve analysis was also performed for the spike experiment to identify the specificity of each sample at each denaturation temperatures. A critical Td (80°C) was identified for the D21S1890 region of chromosome 21 by COLD-PCR. This temperature does allow enrichment of fetal DNA, as fake maternal DNA was undetermined by RT-PCR compared to fake fetal DNA. The spike experiments clearly showed amplification of fake fetal DNA from the mixture of fake fetal and fake maternal DNA at the critical Td of 80°C. Running same samples of spike experiment on genetic analyser identified peaks from all samples at a Td of 95°C, while at a critical Td of 80°C the result showed decreased numbers of maternal peaks, regardless of stutter peaks formation. Melt curve analysis results clearly identified heteroduplex formation in the samples at the critical Td of 80°C. The results represent a good indication for using COLD-PCR in enriching ffDNA for detection by RT-PCR. However, as each individual has only two alleles, the observed results of multiple peaks for fragment analysis were not expected. Further research needs to focus on both eliminating heteroduplex formation and stutter peaks. COLD-PCR has the potential to open a new gateway in NIPD for aneuploidy detection. This method could be particularly useful in the detection of genetic abnormalities in the fetus, in particular Down syndrome and other aneuploidies.

Genetic Disorders and the Fetus - Aubrey Milunsky 2012-12-06

About 21 years ago prenatal diagnosis became part of the physician's diagnostic armamentarium against genetic defects. My first monograph in 1973 (The Prenatal Diagnosis of Hereditary Disorders) critically assessed early progress and enunciated basic principles in the systematic approach to prenatal genetic diagnosis. Six years later and under the current title, a subsequent volume provided the first major reference source on this subject. The present second (effectively third) edition, which was urged in view of the excellent reception of

the two earlier volumes, reflects the remarkable growth of this new discipline and points to significant and exciting future developments. Notwithstanding these advances, the use of the new tools and techniques for the benefit of at-risk parents has taken many more years than most anticipated. Key factors have been the lack of teaching of human genetics in medical schools in the preceding decades and the difficulty of educating practicing physicians in a new scientific discipline. Even today the teaching of genetics in medical schools leaves much to be desired and this will further delay the introduction of newer genetic advances to the bedside.

Markers of Down Syndrome and Fetal Growth Profile in Pregnancies Conceived with Assisted Reproduction - Pui-Wah Hui 2017-01-27

All rights not granted by the above license are retained by the author. Abstract: Assisted reproduction technology is increasingly used for treatment of couples with subfertility. These women are usually of more advanced maternal age and carry a higher risk of fetal Down syndrome. Results from early publications showed that biochemical markers for screening of fetal Down syndrome in the second trimester were different between pregnancies from in vitro fertilization (IVF) and natural conception. This could potentially increase the false positive rate and result in unnecessary invasive diagnostic procedures. Questions were raised as to whether the alterations were related to ovarian stimulation. This laid the fundamentals of a series of studies presented in this thesis with an aim to address the variations in the concentrations of markers of fetal Down syndrome and the fetal growth profile of pregnancies conceived following different assisted reproduction treatments. Studies were conducted on maternal serum and amniotic fluid alpha fetoprotein (AFP) and human chorionic gonadotrophin (hCG) in the second trimester in pregnancies conceived by assisted reproduction. A reduced level of AFP in

maternal serum in pregnancies with fresh embryos together with an elevated level of hCG in both maternal serum and amniotic fluid in pregnancies with frozen thawed embryos were found. This pioneer piece of data showing the raised hCG in frozen thawed embryo pregnancies with unstimulated treatment cycles spoke against the ovarian driven hypothesis, but suggested placental dysfunction be a possible underlying pathophysiology. For markers adopted in the first trimester, the level of pregnancy associated protein A (PAPP-A) was significantly reduced in pregnancies from assisted reproduction. The data on free β hCG was heterogeneous. Apart from biochemical markers, the nuchal translucency was also increased in these singleton pregnancies but not in dichorionic twins. As the direction of deviations of these markers in unaffected pregnancies from assisted reproduction resembled those observed in pregnancies affected by Down syndrome, appropriate adjustment was necessary to reduce the false positive rate for these women. Altered biochemical markers, notably a low PAPP-A level, were also associated with adverse obstetric outcomes. The changes observed in pregnancies from assisted reproduction might be a manifestation of an intrinsic placental insufficiency or fetal developmental delay. A longitudinal study was performed to examine the intrauterine fetal growth profile in these pregnancies. The rate of increment in the mean sac size, which could represent an adaptive compensatory mechanism, was significantly greater in pregnancies from assisted reproduction compared to natural conception. We concluded that pregnancies conceived after assisted reproduction technology were different from pregnancies from natural conception in terms of the concentrations of biochemical and ultrasound markers of Down syndrome. Due to the wide variation in treatment protocols and patients' background demographics, the exact underlying pathophysiology might be difficult to be explored. Couples undergoing assisted reproduction treatment should be counseled on the increased risk of adverse pregnancy course and perinatal outcome.

Down Syndrome: From Understanding the Neurobiology to Therapy - 2012-10-16

Down syndrome (DS) is the most common example of neurogenetic aneuploid disorder leading to mental retardation. In most cases, DS results from an extra copy of chromosome 21 (HSA21) producing deregulated gene expression in brain that gives rise to subnormal intellectual functioning. The topic of this volume is of broad interest for the neuroscience community, because it tackles the concept of neurogenomics, that is, how the genome as a whole contributes to a neurodevelopmental cognitive disorders, such as DS, and thus to the development, structure and function of the nervous system. This volume of *Progress in Brain Research* discusses comparative genomics, gene expression atlases of the brain, network genetics, engineered mouse models and applications to human and mouse behavioral and cognitive phenotypes. It brings together scientists of diverse backgrounds, by facilitating the integration of research directed at different levels of biological organization, and by highlighting translational research and the application of the existing scientific knowledge to develop improved DS treatments and cures. Leading authors review the state-of-the-art in their field of investigation and provide their views and perspectives for future research. Chapters are extensively referenced to provide readers with a comprehensive list of resources on the topics covered. All chapters include comprehensive background information and are written in a clear form that is also accessible to the non-specialist.

Understanding Your Medical Laboratory Tests and Surgical Biopsy Reports - Robert W. Christie 2005-08-04

This user-friendly book is written to help consumers understand medical clinical laboratory tests and surgical pathology reports. The orientation is toward patients with a medical problem, the worried well who probably don't have a problem, and the medical professionals and allied health providers who do not realize that a huge information gap exists between themselves and their patients. The chapter describing the shortcomings of laboratory test report forms is aimed directly at doctors, laboratorians, and other health care providers with examples of laboratory test report formats that can improve communication between the consumer, the clinical laboratory, and the health care provider. ADVANCE PRAISE FOR Understanding Your Medical Laboratory Tests and Surgical Biopsy Reports "A great resource for the lay population..... and everyone who works at our Clinic should have a copy of this humorous, incisive look into the mysterious world of lab tests!" Penny Durgin, A.D.N.P., Nurse Practitioner "Great idea for a book! I'm sure it will be a great help to patients trying to interpret their lab test results, and it will surely be an aid to medical caretakers in discussing test reports with their patients - and it will be on my bookshelf!" Elwin Falkenham, M.D., Family Practitioner "...the explanations of the lab tests make for fast, easy reading. I hope many doctors and nurse practitioners will read it and learn a few things they really need to know in dealing with apprehensive patients." Annette McMahon, High School teacher "The reach of the subject of laboratory testing is really comprehensive. A reader can go to whatever depth he or she chooses; many will find satisfaction in the informal style and avoidance of medical language that is incomprehensible to patients." John L. Meyer II, M.D., FASCP, Community hospital Pathologist "Using this book, patients will be able to understand the significance of their laboratory tests results. So often explanations from doctors in their offices are too hurried, too technical, and too upsetting for patients to comprehend what their tests really mean." April Whithed, MT(ASCP), Laboratory Manager
