#### **Neurogenic Dysphagia** - Tobias Warnecke 2021-03-05

This book is a clinical manual that covers the whole spectrum of swallowing and its disorders. It starts with physiology of swallowing, pathophysiology of disordered deglutition, diagnostic methods (clinical and instrumental) and ends with an in-depth's and up-to-date presentation of current treatment options. The clinically most relevant topics of dysphagia management on the stroke unit and the intensive care unit are dealt with in separate chapters. Also the closely intertwined issue of nutritional management is specifically addressed. Most importantly, the book covers all obligatory topics of the Flexible Endoscopic Evaluation of Swallowing (FEES)-curriculum, an educational initiative that started in Germany in 2014 and is currently being extended to other European and non-European countries. The book is richly illustrated and an online video section provides a number of typical patient cases. FEES is probably the most commonly chosen method for the objective assessment of swallowing and its disorders. It is used in stroke units, intensive care facilities, geriatric wards but also in rehabilitation clinics and within dedicated outpatient

services. This book on neurogenic dysphagia therefore addresses a wide range of different medical disciplines, such as neurologists, geriatricians, intensive care physicians, rehabilitation physicians, gastroenterologists, otolaryngologists, phoniatrists and also speech-language pathologists.

**Pediatric Dysphagia** - Jay Paul Willging  
2019-12-09

Pediatric Dysphagia: Etiologies, Diagnosis, and Management is a comprehensive professional reference on the topic of pediatric feeding and swallowing disorders. Given that these disorders derive from abnormalities in the function and/or structure of the airway and digestive systems, multiple clinical specialists may be involved in the evaluation and management of affected children at any given point in time. Therefore, this text includes significant contributions from a wide range of experts in pediatric dysphagia, including all members of the Interdisciplinary Feeding Team at Cincinnati Children's Medical Center. These experts present an in-depth description of their roles in the diagnosis and management of dysphagic children, providing the reader with an understanding of why a multidisciplinary model of care is key to the optimization of outcomes.

Pediatric Dysphagia is divided into five parts. In Part I, readers are provided with an overview of the embryologic development of aerodigestive structures that relate to swallowing, an introduction to neural organization related to swallowing function and physiologic aspects of swallowing, a synopsis of oral motor development, a discussion of the various etiologic categories of feeding and swallowing disorders, and an overview of genetic disorders associated with feeding and swallowing issues. Part II covers the clinical and instrumental assessment of patients, including the interdisciplinary feeding team infrastructure and function, the roles of individual members of the feeding team, the specific

diagnostic tests commonly used in the assessment of feeding and swallowing issues, the classification of neonatal intensive care units, and the assessment and management of feeding and swallowing issues encountered in the neonatal intensive care unit. Part III focuses on the management of pediatric dysphagia, covering a wide range of treatment strategies and interventions for children with various categories of feeding disorders. Part IV includes an introduction to the concept of evidence-based practice and the application of evidence-based strategies in the management of dysphagia. Part V presents a brief overview of the role of ethics in healthcare and ethical considerations in the treatment of dysphagic children. In summary, the overall aim of this comprehensive text is to provide all pediatric professionals involved in the care of dysphagic patients with a basic understanding of the complexity of this disorder, the anatomic, neurologic, and physiologic components involved in this disorder, an overview of the diverse population of children who suffer with this disorder, and with a wide range of management approaches based on patient needs and capabilities. The authors also address clinical problem solving and decision making, inspiring readers to develop multidisciplinary models of care at their own institutions.

### **Dysphagia Assessment and Treatment Planning** - Rebecca Leonard 2018-03-09

*Dysphagia Assessment and Treatment Planning: A Team Approach, Fourth Edition* is an ideal resource for dysphagia courses in speech-language pathology graduate programs. The unique value of this book is its multidisciplinary approach. Too often, speech-language pathologists function clinically with insufficient interaction with, or understanding of, the roles of other professionals involved with their patients. This text incorporates information pertinent to the roles, tools, and views of a multidisciplinary dysphagia team, including physicians, speech pathologists, nurse specialists, and dietitians, who work together on a daily basis. In this fourth edition, the organization has changed, with chapters concerned with assessment techniques coming first, and material addressing special populations comprising the latter portion of the text. This reflects what is likely a more typical approach to dysphagia in graduate courses concerned with the topic and one that complements teaching of the subject matter. Updates to the fourth edition include: The treatment chapter (Chapter 10) has been updated to reflect the current status of therapeutic approaches previously considered in treating dysphagic patients. Chapters dealing with nursing (Chapter 11) and nutrition (Chapter 12) have been updated to

incorporate the latest recommendations in nursing care and dietary considerations for patients experiencing dysphagia. The pediatrics chapter (Chapter 13) has been expanded to address specific problems and needs not only of infants but also the entire spectrum of childhood. A chapter devoted to the esophagus (Chapter 14) addresses new information on the management of esophageal disorders, including the novel double-balloon dilation of the UES and a device for manually opening the upper esophagus. Chapters addressing special populations, including neurogenic disease (Chapter 15) and head and neck cancer (Chapter 16), incorporate the latest information regarding dysphagia and approaches to treatment pertinent to each group. A brand-new addition to the book is Chapter 18, which addresses dysphagia associated with alterations to the spine as a consequence of either disease or surgery.\*Disclaimer: Please note that ancillary content (such as documents, audio, and video, etc.) may not be included as published in the original print version of this book.

Dysphagia Treatment Planning - Jennifer Dawn Danielson 2012

The Modified Barium Swallow (MBS) study is a commonly used radiographic procedure for diagnosis and treatment of swallowing disorders. Despite attempts by dysphagia specialists to standardize the MBS, most settings have not adopted such standardized procedures. High variability of assessment patterns arguably contribute to variability of treatment recommendations made from diagnostic information derived from the MBS. An online survey was distributed to SLPs participating in American Speech Language Hearing Association (ASHA) listservs. Sixty-three SLPs currently treating swallowing disorders participated. Outcome measures included 1) descriptive measures of participant demographics and 2) inter-rater agreement for treatment target and strategy recommendations made following review of MBS reports in low and high pathophysiology conditions, 3) chi-square analyses comparing target and strategy recommendations according to report stimulus, and 4) descriptive measures of clinicians' ratings of four MBS reports, including the information they reported as most useful for making treatment recommendations. Results indicated wide variability among clinicians for recommended treatment targets and techniques. Chi-square analyses revealed associations between target selection and appropriate treatment recommendations except when comparing compensatory and restorative recommendations in the low pathology condition. Results indicated a difference in the distributions (p

*Dementia* - Jacqueline Kindell 2017-07-05  
This informative manual draws on expert research to highlight the feeding and swallowing difficulties that can occur with dementia. It is also a practical guide that offers potential strategies to manage these problems. Professionals are encouraged to focus on the needs of the individual by providing practical questions that should be asked when making an assessment. This is achieved through a step-by-step process, which allows a worker to observe, document and manage feeding and swallowing difficulties. Forms, schedules and checklists that can be photocopied are provided to aid in implementation. This is a detailed, practical resource which offers support and direction for speech and language therapists, and others with an interest in swallowing problems, working with people with dementia. It includes case studies to illustrate theory in practice, as well as a wide ranging bibliography.

**Here's How to Do Therapy** - Debra M. Dwight 2022-01-07

Includes Videos! The new and significantly updated third edition of Here's How to Do Therapy: Hands-On Core Skills in Speech-Language Pathology is an essential resource on effective evidence-based interventions for both practicing clinicians and students in academic speech-language pathology programs. Unique in design and content, the book provides a logical and manageable approach to enhance clinical skills through guided practice for different types of communication disorders. Part I presents the basic considerations and foundations of the therapeutic process. Twenty-eight fundamental therapeutic skills are presented in a "workshop format" using organizers, definitions/demonstrations, think-out-loud questions, prompts for practice, post-organizers, and more. Readers are guided through a process for learning and demonstrating each of the 28

specific skills through use of three tools: Therapeutic-Specific Workshop Forms, Video Vignettes, and one Mini-Therapy Session. Part II of the text contains seven Guided Practice chapters, with selected concepts and scripted examples of therapy sessions for receptive and expressive language, social communication for children with autism spectrum disorder (ASD), articulation and phonology, voice, swallowing, resonance, and adult cognitive communication. *Clinical Care and Rehabilitation in Head and Neck Cancer* - Philip C. Doyle 2019-03-21 Malignancies involving structures of the head and neck frequently impact the most fundamental aspects of human existence, namely, those functions related to voice and speech production, eating, and swallowing. Abnormalities in voice production, and in some instances its complete loss, are common following treatment for laryngeal (voice box) cancer. Similarly, speech, eating, and swallowing may be dramatically disrupted in those where oral structures (e.g., the tongue, jaw, hard palate, pharynx, etc.) are surgically ablated to eliminate the cancer. Consequently, the range and degree of deficits that may be experienced secondary to the treatment of head and neck cancer (HNCA) are often substantial. This need is further reinforced by the Centers for Disease Control and Prevention who have estimated that the number of individuals who will be newly diagnosed with HNCA will now double every 10 years. This estimate becomes even more critical given that an increasing number of those who are newly diagnosed will be younger and will

experience the possibility of long-term survival post-treatment. Contemporary rehabilitation efforts for those treated for HNCA increasingly demand that clinicians actively consider and address multiple issues. Beyond the obvious concerns specific to any type of cancer (i.e., the desire for curative treatment), clinical efforts that address physical, psychological, communicative, and social consequences secondary to HNCA treatment are essential components of all effective rehabilitation programs. Comprehensive HNCA rehabilitation ultimately seeks to restore multiple areas of functioning in the context of the disabling effects of treatment. In this regard, rehabilitation often focuses on restoration of function while reducing the impact of residual treatment-related deficits on the individual's overall functioning, well-being, quality of life (QOL), and ultimately, optimize survivorship. Regardless of the treatment method(s) pursued for HNCA (e.g., surgery, radiotherapy, chemoradiation, or combined methods), additional problems beyond those associated with voice, speech, eating and swallowing frequently exist. For example, post-treatment changes in areas such as breathing, maintaining nutrition, limitations in physical capacity because surgical reconstruction such as deficits in shoulder functioning, concerns specific to cosmetic alterations and associated disfigurement, and deficits in body image are common. Those treated for HNCA also may experience significant pain, depression, stigma and subsequent social isolation. Concerns of this type have led clinicians and researchers to describe HNCA as the most emotionally traumatic form of cancer. It is, therefore, essential that clinicians charged with the care and rehabilitation of those treated for HNCA actively seek to identify, acknowledge, and systematically address a range of physical, psychological, social, and communication problems. Efforts that systematically consider this range of post-treatment sequelae are seen as critical to any effort directed toward enhanced rehabilitation outcomes. Actively and

purposefully addressing post-treatment challenges may increase the likelihood of both short- and long-term rehabilitation success in this challenging clinical population. Current information suggests that successful clinical outcomes for those with HNCa are more likely to be realized when highly structured, yet flexible interdisciplinary programs of care are pursued. Yet contemporary educational resources that focus not only on management of voice, speech, eating, and swallowing disorders, but also address issues such as shoulder dysfunction due to neck dissection, the significant potential for cosmetic alterations can offer a much broader perspective on rehabilitation. Contemporary surgical treatment frequently involves reconstruction with extensive procedures that require donor sites that include both soft tissue from a variety of locations (e.g., forearm, thigh, etc.), as well as bone (e.g., the scapula). Collectively, resources that address these issues and many other concerns and the resultant social implications of HNCa and its treatment can serve to establish a comprehensive framework for clinical care. Consequently, providing a highly specialized and comprehensive educational resource specific to HNCa rehabilitation is currently needed. The proposed edited book is designed to address this void in a single authoritative resource that is also accessible to the clinical readership. Integral to this proposed book is information that guides clinical approaches to HNCa rehabilitation, in addition to offering emphasis on the direct impact of changes in voice, speech, and swallowing and the impact of such losses on outcomes. Finally, while several other published sources currently exist (see attached list), the emphasis of these books is directed either toward the identification and diagnosis of malignant disease, clinical and surgical pathology, associated efforts directed toward biomedical aspects of cancer and its treatment, or those with a focus on a single clinical problem or approach to rehabilitation. Therefore, the content of the proposed multi-chapter text

centers on delivering a systematically structured, comprehensive, and clinically-oriented presentation on a range of topics that will provide readers at a variety of levels with a strong, well-integrated, and empirically driven foundation to optimize the clinical care of those with HNCa. The primary audience for this textbook is undergraduate and graduate-level students in Speech-Language Pathology, as well as practitioners, especially hospital-based practitioners, in Speech-Language Pathology; other key audiences include junior and senior level otolaryngology residents and fellows, translational researchers in head and neck cancer, related medical specialists (e.g., radiation oncology), oncology nurses, and potentially other rehabilitation professionals such as occupational therapists, counseling psychologists, social workers, and rehabilitation counselors.
