Two Plus Two Is Not Five - Susan R. Greenwald 2006-04
This supplementary workbook is for children ages six and up, and has reproducible pages to give students an opportunity to learn the math facts. The addition and subtraction facts to 18 are taught in an original way- not just drill and practice, but by grouping and associating them with easy-to-learn methods and tricks. Each page was carefully designed; the facts are introduced with a trick and then those facts are practiced by trick name with previously learned facts, also identified by their trick name. After initial instruction, teachers/parents can assign workbook pages for class work or homework to give children practice and review. Not all students will need to do all of the pages. Cumulative practice pages include most, if not all, of the tricks taught to that point. The children will see that they can be successful in completing pages without counting on fingers or using a chart. This book will complement any mathematics curriculum, and is a perfect resource for parents, teachers, special education, and home school programs. Included in the book: Introduction, How to Use the Book, 232 workbook pages, Answer keys, Certificate of Mastery, Record-Keeping pages, Index

Different Ways Children Learn to Add and Subtract - Thomas A. Romberg 1987

This monograph summarises the findings from five related studies carried out in Sandy Bay, Tasmania, in 1979-80. The overall purpose of the studies was to examine whether children in Years 1-3 who differed in cognitive capacity learned to add and subtract in different ways. The first study was a cross-sectional survey designed to determine the memory capacity of a population of children. The second study was designed to portray performance differences on a variety of mathematically related developmental tasks for the same population of

children. Data from these two studies were used to form groups of children who different in cognitive capacity. Six groups were formed via cluster analysis, with memory capacity being the primary distinguishing characteristic. The third, fourth, and fifth studies each used a sample of students from the six cluster groups across grades. The third study examined both the performance and the strategies these children used to solve a structured set of addition and subtraction word problems. The fourth study involved repeated assessment of the children's performance on items measuring objectives related to addition and subtraction. In the last study these children and their teachers were observed during classroom instruction in mathematics to see how addition and subtraction were taught and whether or not instruction was related to the children's cognitive capacity. The results show that children's differences in capacity were reflected in their performance on both verbal and standard problems and in the strategies they used to solve problems.
