Applications of Non-Gaussian Models to the Solution of Structural Engineering Problems - Federico Waisman-Abarno 1998

The major sources of uncertainties in engineering problems are the input actions and the system characteristics. Environmental loads such as earthquakes, ocean waves and wind are examples of input actions. The distribution of these actions are non-Gaussian, as various statistical analysis of observed phenomena shows.

Climate Change isn't Everything - Mike Hulme 2023-08-18

The changing climate poses serious dangers to human and non-human life alike, though perhaps the most urgent danger is one we hear very little about: the rise of climatism. Too many social, political and ecological problems facing the world today – from the Russian invasion of Ukraine to the management of wildfires – quickly become climatized, explained with reference to ‘a change in the climate’. When complex political and ethical challenges are so narrowly framed, arresting climate change is sold as the supreme political challenge of our time and everything else becomes subservient to this one goal. In this far-sighted analysis, Mike Hulme reveals how climatism has taken hold in recent years, becoming so pervasive and embedded in public life that it is increasingly hard to resist it without being written off as a climate denier. He confronts this dangerously myopic view that reduces the condition of the world to the fate of global temperature or the atmospheric concentration of carbon dioxide to the detriment of tackling serious issues as varied as poverty, liberty, biodiversity loss, inequality and international diplomacy. We must not live as though climate alone determines our present and our future. Middle East Record Volume 2, 1961 - Yitzhak Oron 1961

Revitalizing Urban Waterway Communities - Richard Smardon 2018-06-19

The revitalizing and restoration of rivers, creeks and streams is a major focus of urban conservation activity throughout North America and Europe. This book presents models and examples for organizing multiple stakeholders for purposes of waterway revitalization - if not restoration - within a context of fairness and environmental justice. After decades of neglect and misuse the complexity of cleaning up urban rivers and streams is shown to be complex and truly daunting. Urban river cleanup typically involve multiple agendas and stakeholders, as well as complicated technical issues. It is also often the situation that the most affected have the least voice in what happens. The authors present social process models for maximum inclusion of various stakeholders in decision-making for urban waterway regeneration. A range of examples is presented, drawn principally from North America and Europe.

Water Resources in the Built Environment - Colin A. Booth 2014-03-31
Water management is a key environmental issue in controlling offloods and reducing droughts. This book provides analysis of the main issues, offering solutions and describing good practice. *Water Resources for the Built Environment: management issues and solutions* develops an appreciation of the diverse, complex and current themes of the water resources debate across the built environment, urban development and management continuum. The integration of physical and environmental sciences, combined with social, economic and political sciences, provide a unique resource, useful to policy experts, scientists, engineers and subject enthusiasts. By taking an interdisciplinary approach, water resources issues and impacts on the built environment are presented in the inventive and strategic setting of considering the constraints of delivering potable water to an ever-demanding society who, at the same time, are increasingly aware of living in an urban landscape where excessive surface water creates a flood-threatened environment – hence, the need to portray a balance between ‘too little vs. too much’. This unique approach to the water resources debate presents a multifaceted collection of chapters that address the contemporary concomitant issues of water shortage and urban flooding and proffers solutions specifically for the built environment. The book is structured into three parts: the first part (Sections 2, 3 and 4) addresses management issues and solutions to minimise water shortages and provide water security for society; whilst the second part of the book (Sections 5 and 6) addresses management issues and solutions to control excessive rainfall and minimise flooding impacts. The third part (Section 7) contextualises the issues of the earlier sections within international case studies from the developing world.

Numerical and Computer Methods in Structural Mechanics - Steven J. Fenves 2014-05-10

Numerical and Computer Methods in Structural Mechanics is a compendium of papers that deals with the numerical methods in structural mechanics, computer techniques, and computer capabilities. Some papers discuss the analytical basis of the computer technique most widely used in software, that is, the finite element method. This method includes the convergence (in terms of variation principles) isoparametrics, hybrid models, and incompatible displacement models. Other papers explain the storage or retrieval of data, as well as equation-solving algorithms. Other papers describe general-purpose structural mechanics programs, alternatives to, and extension of the usual finite element approaches. Another paper explores nonlinear, dynamic finite element problems, and a direct physical approach to determine finite difference models. Special papers explain structural mechanics used in computing, particularly, those related to integrated data bases, such as in the Structures Oriented Exchange System of the Office of Naval Research and the integrated design of tanker structures. Other papers describe software and hardware capabilities, for example, in ship design, fracture mechanics, biomechanics, and crash safety. The text is suitable for programmers, computer engineers, researchers, and scientists involved in materials and industrial design.
