This alternator and alternator regulator repair manual has been prepared and published to cover for models RS40, RS41, MS40, MS41, and FJ40 utilizing the AC alternator in place of the DC generators.

The alternators utilized for the above mentioned models are same, but the alternator regulators differ in the construction due to the usage of the charge warning lamp which requires a relay for this circuit.

**Improved Performance Alternator with Fully Integrated Switched-Mode**

**Rectifier** - Armando Mesa 2008

The use of Power Electronic circuits has helped to advance the technology of automotive alternators. The use of a Switched-Mode Rectifier (SMR) allows the alternator to run at a load-matched condition, optimizing power and efficiency over all operating speeds. However, the use of SMR's has largely been focused on designs for 42 V alternators. This thesis presents the design, build, and characterization of an SMR-based alternator that provides improved power and efficiency at the present automotive standard of 14 V. The SMR-based machine was built from commercial electronic devices and packaged such that it could be fully integrated into the alternator housing without impacting the physical structure or reliability. The SMR-based alternator was characterized in a laboratory environment (25°C ambient temperature) over the

standard operating range of 1500 rpm (idle speed) to 6000 rpm (cruising speed). The alternator operated in a load-matched condition, achieving maximum power output up to 2400 rpm and achieved cruising speed output power of 2178 W at full field current of 4.3 A.
